

Pallet Stackers and Dispensers (Empty Pallets)

Stackers and Dispensers are typically used in palletizing lines to either stack empty pallets or dispense a stack of pallets one at a time into an area where product will be loaded onto the pallet.

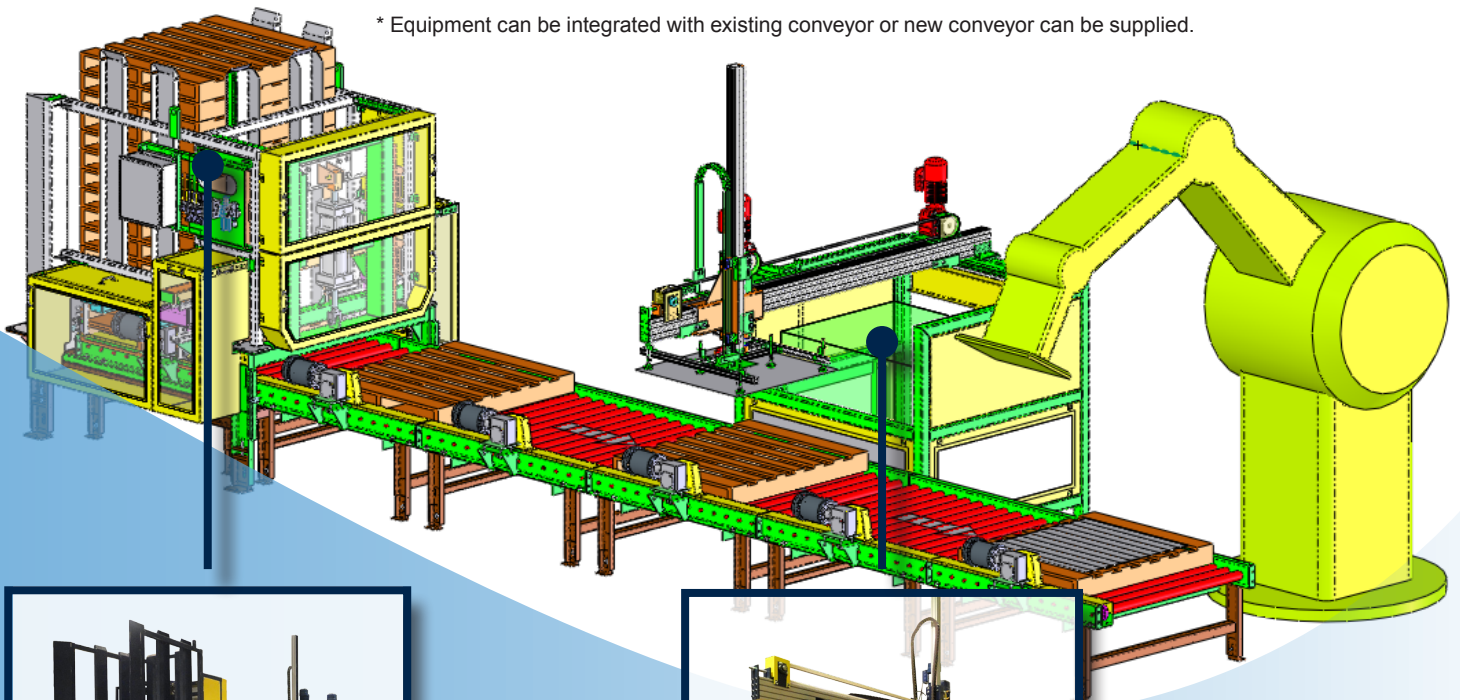

Unloading a stack of pallets in a Stacker or loading a stack of pallets into a dispenser magazine can be via forklift or conveyed into position. Stackers and Dispensers are supplied with a pneumatically actuated carriage lift and engaging forks.

Pick and Place

A Pick and Place is used to pick a slip sheet off a stack of sheets and place it on a pallet where loading a pallet or layer forming needs to take place. The Pick and Place is a belt driven carriage transfer with a bed of vacuum suction cups that lowers to the stack of slip sheets.

Other products where Pick and Places are used: plywood and polymer carrier boards, corrugated shipping base boards, short sided pallet tops and bottoms.

* Equipment can be integrated with existing conveyor or new conveyor can be supplied.
